Estimate summary

Upfront cost 0.00 USD	Monthly cost 3,733.20 USD	Total 12 months cost 44,798.40 USD Includes upfront cost
---------------------------------	-------------------------------------	---

Detailed Estimate

Name Amazon EC2	Group -	Region Europe (Ireland)	Upfront cost 0.00 USD	Monthly cost 107.16 USD
Status	-			
Description:	-			
Config summary	Tenancy (Shared Instances), Operating system (Linux), Workload (Consistent, Number of instances: 2), Advance EC2 instance (m6g.xlarge), Pricing strategy (Amazon EC2 Instance Savings Plans 3yr No Upfront), Enable monitoring (disabled), DT Inbound: Not selected (0 TB per month), DT Outbound: Not selected (0 TB per month), DT Intra-Region: (0 TB per month)			
Name AWS Web Application Firewall (WAF)	Group -	Region Europe (Ireland)	Upfront cost 0.00 USD	Monthly cost 51.00 USD
Status	-			
Description:	-			
Config summary	Number of Web Access Control Lists (Web ACLs) utilized (1 per month), Number of Rules added per Web ACL (1 per month), Number of Rules inside each Rule Group (4 per month), Number of Rule Groups per Web ACL (1 per month), Number of Managed Rule Groups per Web ACL (4 per month)			
Name Amazon Route 53	Group -	Region Europe (Ireland)	Upfront cost 0.00 USD	Monthly cost 5.03 USD
Status	-			
Description:	-			
Config summary	Hosted Zones (10.000), Additional Records in Hosted Zones (20.000)			
Name Amazon CloudFront	Group -	Region Europe (Ireland)	Upfront cost 0.00 USD	Monthly cost 420.16 USD
Status	-			
Description:	-			
Config summary	Data transfer out to internet (4 TB per month), Number of requests (HTTPS) (60000000 per month)			
Name Amazon Simple Storage Service (S3)	Group -	Region Europe (Ireland)	Upfront cost 0.00 USD	Monthly cost 35.33 USD
Status	-			
Description:	-			
Config summary	S3 Standard storage (1.5 TB per month)			
Name Amazon CloudWatch	Group -	Region Europe (Ireland)	Upfront cost 0.00 USD	Monthly cost 6.60 USD
Status	-			
Description:	-			
Config summary	Number of Metrics (includes detailed and custom metrics) (22)			
Name Amazon Virtual Private Cloud (VPC)	Group -	Region Europe (Ireland)	Upfront cost 0.00 USD	Monthly cost 70.08 USD
Status	-			
Description:	-			
Config summary	Working days per month (22) Number of NAT Gateways (2)			
Name Elastic Load Balancing	Group -	Region Europe (Ireland)	Upfront cost 0.00 USD	Monthly cost 602.40 USD

Status -
Description: -
Config summary Number of Application Load Balancers (1)

Name	Group	Region	Upfront cost	Monthly cost
Amazon ElastiCache	-	Europe (Ireland)	0.00 USD	1,601.95 USD
Status	-			
Description:	-			
Config summary	Engine (Redis OSS), Instance type (cache.r6g.large), Cache Engine (Memcached), Nodes (1), Utilization (On-Demand only) (24 Hours/Day), Cache Node Type (Memory optimized), Pricing strategy (OnDemand), Nodes (0), Instance type (cache.r6gd.xlarge), Utilization (On-Demand only) (80 %Utilized/Month), Cache Engine (Redis), Cache Node Type (Memory optimized), Pricing strategy (OnDemand), Average cache data size (in GB) (10), Average simple request rate (166 per second), Average data transferred per request [KBs] (249)			

Name	Group	Region	Upfront cost	Monthly cost
Amazon RDS for MariaDB	-	Europe (Ireland)	0.00 USD	412.93 USD
Status	-			
Description:	-			
Config summary	Storage amount (100 GB), Nodes (1), Instance type (db.r6g.large), Utilization (On-Demand only) (100 %Utilized/Month), Deployment selection (Multi-AZ), Pricing strategy (OnDemand), Storage volume (General Purpose SSD (gp2))			

Name	Group	Region	Upfront cost	Monthly cost
Amazon Elastic File System (EFS)	-	Europe (Ireland)	0.00 USD	1.10 USD
Status	-			
Description:	-			
Config summary	Infrequent Access Read (100 GB per month)			

Name	Group	Region	Upfront cost	Monthly cost
AWS Private Certificate Authority	-	Europe (Ireland)	0.00 USD	415.00 USD
Status	-			
Description:	-			
Config summary	Number of general purpose mode private certificates issued (20), Number of Private CAs (1)			

Name	Group	Region	Upfront cost	Monthly cost
Amazon Simple Storage Service (S3)	-	Europe (Ireland)	0.00 USD	4.46 USD
Status	-			
Description:	-			
Config summary	S3 Standard storage (194 GB per month) DT Inbound: Not selected (0 TB per month), DT Outbound: Not selected (0 TB per month)			

Acknowledgement

AWS Pricing Calculator provides only an estimate of your AWS fees and doesn't include any taxes that might apply. Your actual fees depend on a variety of factors, including your actual usage of AWS services. [Learn more](#)

DETAILS

REGION

Our region was chosen as Ireland. Because this region is the closest region to our geographic but you may ask that why didn't chose Frankfurt region – right and you're right – because, if we compare with Ireland and Frankfurt:

- > Ireland is generally cheaper than Frankfurt.
- > New AWS services generally roll out first in Ireland.
- > Ireland is AWS's first location in Europe, so it can deliver lower latency across more Western European regions.
- > Frankfurt has stricter regulations, so Ireland is more flexible.
- > Ireland has many AZ's (Availability Zone) and offers good infrastructure

EC2 INSTANCE

We chose **m6g.xlarge** because it is based on **Graviton architecture**, which provides **20–40% lower cost** compared to an equivalent x86 instance. Since our workload is **WordPress**, mainly running on **PHP and MariaDB/MySQL**, Graviton is a well-optimized option.

S3 BUCKET

It is object-based storage service and static files are stored. Static file is that cacheable content that is served directly without changing or processing. It is the most critical acceleration point in web performance.

ROUTE 53

It makes DNS (Domain Name System) management, directs domain name to correct IP address and provides high – availability with health control.

Security Group: Instance security (Who is entering from which port?)

NACL: Subnet security (Traffic control at IP level)

WAF: Application security (Is the content of the request safe?)

Alignment: NACL --> Security Group --> WAF --> Application

CloudWatch

It is monitoring services. CloudWatch seems like heartbeat, it follows logs and metrics and minds automatic action with alarms.

CloudWatch: Performance, metric, log and alarm management

CloudTrail: Recording AWS API calling and user activities

Config: Tracking the configuration history of AWS resources.

CloudFront (CDN Service)

It caches our content worldwide and delivers it to the user from the closest point (Layer 7), which increases speed and performance.

Web Application Firewall (WAF)

WAF filters traffic that comes to web applications, prevents the attack that malicious – like as DDoS – and allows only safe requests.

ACM: Communication security

WAF: Content security

Internet Gateway (IGW) and NAT Gateway

IGW is the door that connects VPC bidirectionally (inbound – outbound) to internet. Machines on public subnet, reach to internet directly through the IGW, machines on private subnet is canalized by NAT Gateway.

NAT Gateway service ensures that resources within the private subnet can securely access the internet while blocking direct access requests from outside. Because it's a managed AWS service, it doesn't require any additional maintenance.

AWS VPN (Virtual Private Network)

It provides secure and encrypted communication between two points by creating a private tunnel over the Internet. The internet, which is normally open to everyone, forces you to become like a private network. VPN server is placed to public subnet because it has to reach from out of world. Thus it provides both security and availability.

If VPN is placed to private subnet; a NAT Gateway or Bastion Host must be placed in front of it but this complicates architecture.

Schema

User --> VPN Server --> Application/DB Servers

AWS RDS

It provides operating database in a managed way. Backup is the continuous copying process that makes to protect the database opposite errors, lossing or corruptions.

There are two types on RDS:

-> **Automated:** It takes backup automatically and on by default.

It stores along the retention period (1- 35 days)

-> **Manuel Snapshots:** You can get it whenever you want and it doesn't erase automatically.

Importance

Disaster Recovery: It makes reloading when DB is broken or erased by the mistake

Migration: A new RDS instance can be created from backup and run in another region.

High Availability: Thanks to backup, data isn't lost and continuity is ensured.

Elastic File Storage (EFS)

EFS is the shared file system; it can be connected to multiple EC2 instances simultaneously.

How can EFS be mounted on multiple machines?

Mount Target: A mount target is added to each subnet for use within a VPC. Thus EC2's that place in subnets can be connect to EFS.

Shared Storage: Files are stored in a place, EC2 behaves like client. Any changes made to the file system are instantly visible to all machines.

Permissions: EFS controls that which instance will access what with IAM and NFS permissions. In this way, it provides both multi – instance and safe structure.

Performance and Scaling: EFS automatically grows, providing small capacity for small files and large capacity for large ones. Dozens of EC2s can be used simultaneously, all accessed in parallel.

-> EFS manages own capacity automatically (It makes auto scaling)

ElastiCache

ElastiCache keeps frequently used data in memory, making the application much faster and reducing database load.

Memcached (Key – Value Logic): RAM based fast cache

-> It is very fast but it is not persistent.

-> **Best area of use:** frequently queried, short-lived data (WordPress Cache)

-> It is multi – threaded (takes advantage of multi-core CPUs)

-> Data lightweight (ideal only for caching)

Redis: (Enhanced cache with rich data structures, persistence and high availability features)

-> Richer data structure = string, list, hash, sorted list..

-> **Area of use:** caching + messaging + session management + pub/sub

-> Replication and high – availability supports are powerful

-> Single – threaded (but it scales with cluster)

While Memcached is ideal for lightweight and simple caches, Redis is preferred in critical applications with its richer data structures and persistence features.

Load Balancer

Application Load Balancer: It is a managed AWS service that distributes HTTP/HTTPS traffic across multiple targets based on content-based rules. It improves availability, security, and flexibility for applications.

Network Load Balancer: It is a load balancer that manages incoming traffic at the application layer.

Gateway Load Balancer: It moves traffic to safety boxes and balances the load.
